24. D The maximum acceleration will occur when its derivative changes from positive to negative or at an endpoint of the interval. $a(t) = v'(t) = 3t^2 - 6t + 12 = 3(t^2 - 2t + 4)$ which is always positive. Thus the acceleration is always increasing. The maximum must occur at $t = 3$ where $a(3) = 21$

25. D The area is given by $\int_0^2 x^2 - (-x)\,dx = \left(\frac{1}{3}x^3 + \frac{1}{2}x^2\right)\Big|_0^2 = \frac{8}{3} + 2 = \frac{14}{3}$.

26. A Any value of k less than 1/2 will require the function to assume the value of 1/2 at least twice because of the Intermediate Value Theorem on the intervals [0,1] and [1,2]. Hence $k = 0$ is the only option.

27. A $\frac{1}{2}\int_0^2 x^2\sqrt{x^3+1}\,dx = \frac{1}{2}\int_0^2 (x^3+1)^{\frac{1}{2}}\left(\frac{1}{3}\cdot 3x^2\right)dx = \frac{1}{2}\cdot\frac{1}{3}\cdot\frac{2}{3}(x^3+1)^{\frac{3}{2}}\Big|_0^2 = \frac{1}{9}\left(9^{\frac{3}{2}} - 1^{\frac{3}{2}}\right) = \frac{26}{9}$

28. E $f'(x) = \sec^2(2x)\cdot\frac{d}{dx}(2x) = 2\sec^2(2x)$; $f'\left(\frac{\pi}{6}\right) = 2\sec^2\left(\frac{\pi}{3}\right) = 2(4) = 8$

76. A From the graph it is clear that f is not continuous at $x = a$. All others are true.

77. C Parallel tangents will occur when the slopes of f and g are equal. $f'(x) = 6e^{2x}$ and $g'(x) = 18x^2$. The graphs of these derivatives reveal that they are equal only at $x = -0.391$.

78. B $A = \pi r^2 \Rightarrow \frac{dA}{dt} = 2\pi r\frac{dr}{dt}$. However, $C = 2\pi r$ and $\frac{dr}{dt} = -0.1$. Thus $\frac{dA}{dt} = -0.1C$.

79. A The graph of the derivative would have to change from positive to negative. This is only true for the graph of f'.

80. B Look at the graph of $f'(x)$ on the interval $(0,10)$ and count the number of x-intercepts in the interval.

81. D Only II is false since the graph of the absolute value function has a sharp corner at $x = 0$.

82. E Since F is an antiderivative of f, $\int_1^3 f(2x)\,dx = \frac{1}{2}F(2x)\Big|_1^3 = \frac{1}{2}\left(F(6) - F(2)\right)$

83. B $\lim\limits_{x\to a}\frac{x^2 - a^2}{x^4 - a^4} = \lim\limits_{x\to a}\frac{x^2 - a^2}{(x^2 - a^2)(x^2 + a^2)} = \lim\limits_{x\to a}\frac{1}{(x^2 + a^2)} = \frac{1}{2a^2}$

84. A A known solution to this differential equation is $y(t) = y(0)e^{kt}$. Use the fact that the population is $2y(0)$ when $t = 10$. Then
$2y(0) = y(0)e^{k(10)} \Rightarrow e^{10k} = 2 \Rightarrow k = (0.1)\ln 2 = 0.069$

85. C There are 3 trapezoids. $\frac{1}{2}\cdot 3\left(f(2) + f(5)\right) + \frac{1}{2}\cdot 2\left(f(5) + f(7)\right) + \frac{1}{2}\cdot 1\left(f(7) + f(8)\right)$

86. C Each cross section is a semicircle with a diameter of y. The volume would be given by
$$\int_0^8 \frac{1}{2}\pi\left(\frac{y}{2}\right)^2 dx = \frac{\pi}{8}\int_0^8 \left(\frac{8 - x}{2}\right)^2 dx = 16.755$$

87. D Find the x for which $f'(x) = 1$. $f'(x) = 4x^3 + 4x = 1$ only for $x = 0.237$. Then $f(0.237) = 0.115$. So the equation is $y - 0.115 = x - 0.237$. This is equivalent to option (D).

88. C $F(9)-F(1)=\int_1^9 \frac{(\ln t)^3}{t}\,dt=5.827$ using a calculator. Since $F(1)=0$, $F(9)=5.827$.

Or solve the differential equation with an initial condition by finding an antiderivative for $\frac{(\ln x)^3}{x}$. This is of the form u^3du where $u=\ln x$. Hence $F(x)=\frac{1}{4}(\ln x)^4+C$ and since $F(1)=0$, $C=0$. Therefore $F(9)=\frac{1}{4}(\ln 9)^4=5.827$

89. B The graph of $y=x^2-4$ is a parabola that changes from positive to negative at $x=-2$ and from negative to positive at $x=2$. Since g is always negative, f' changes sign opposite to the way $y=x^2-4$ does. Thus f has a relative minimum at $x=-2$ and a relative maximum at $x=2$.

90. D The area of a triangle is given by $A=\frac{1}{2}bh$. Taking the derivative with respect to t of both sides of the equation yields $\frac{dA}{dt}=\frac{1}{2}\left(\frac{db}{dt}\cdot h+b\cdot\frac{dh}{dt}\right)$. Substitute the given rates to get $\frac{dA}{dt}=\frac{1}{2}(3h-3b)=\frac{3}{2}(h-b)$. The area will be decreasing whenever $\frac{dA}{dt}<0$. This is true whenever $b>h$.

91. E I. True. Apply the Intermediate Value Theorem to each of the intervals $[2,5]$ and $[5,9]$.

II. True. Apply the Mean Value Theorem to the interval $[2,9]$.

III. True. Apply the Intermediate Value Theorem to the interval $[2,5]$.

92. D $\int_k^{\frac{\pi}{2}}\cos x\,dx=0.1\Rightarrow\sin\left(\frac{\pi}{2}\right)-\sin k=0.1\Rightarrow\sin k=0.9$. Therefore $k=\sin^{-1}(0.9)=1.120$.
