

Math 3: Lesson 2-1 Graphing Polynomial Functions (Notes)

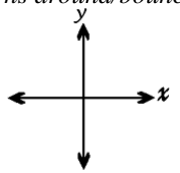

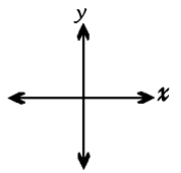

Determining the END BEHAVIOR of the graph

<p>Even Degree Positive Leading Coefficient</p>  <p>Left _____ Right _____</p> <p>As $x \rightarrow -\infty, y \rightarrow$ As $x \rightarrow \infty, y \rightarrow$</p>	<p>Even Degree Negative Leading Coefficient</p>  <p>Left _____ Right _____</p> <p>As $x \rightarrow -\infty, y \rightarrow$ As $x \rightarrow \infty, y \rightarrow$</p>	<p>Odd Degree Positive Leading Coefficient</p>  <p>Left _____ Right _____</p> <p>As $x \rightarrow -\infty, y \rightarrow$ As $x \rightarrow \infty, y \rightarrow$</p>	<p>Odd Degree Negative Leading Coefficient</p>  <p>Left _____ Right _____</p> <p>As $x \rightarrow -\infty, y \rightarrow$ As $x \rightarrow \infty, y \rightarrow$</p>
--	--	---	---

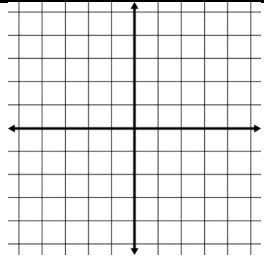

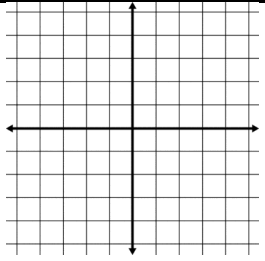

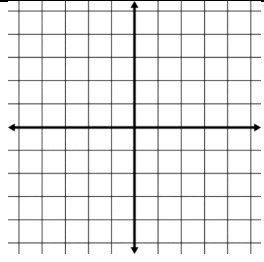

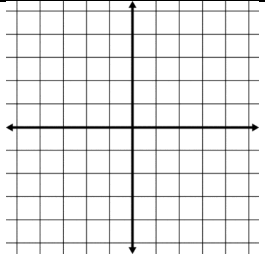

Determining the ZEROS/ROOTS/SOLUTIONS/X-INTERCEPTS of the graph

1. Write equation in standard form and set equal to zero.
2. Factor completely and set each factor equal to zero and solve (use quadratic formula if necessary).
3. If given a zero or a factor, use synthetic division to find other factors/zeros.
4. The degree indicates how many real/complex zeros there are.

Determining the MULTIPLICITY of the zeros

<p>Even Multiplicity <i>Touches the x-axis at the zero and then turns around/bounces</i></p> 	<p>Odd Multiplicity <i>Crosses the x-axis at the zero</i></p> 
--	---

EXAMPLES: Determine the end behavior, zeros, multiplicity at each zero, and y-intercept, then draw the graph.

<p>$P(x) = x^3 + x^2 - 6x$</p> 	<p>$P(x) = x^3 + 3x^2 - 4x - 12$</p> 
<p>$P(x) = (x - 3)^3(x + 1)^4$</p> 	<p>$P(x) = -(x - 3)^3(x + 1)^2$</p> 

Given: $P(x) = 2x^3 + x^2 - 13x + 6$ and $(x - 2)$ is a factor.

$P(x) = x^3 - 8x^2 + 19x$
