

LEOPARD SHARK

by
Cody

The leopard shark was first discovered in 1855. The leopard shark's size is about 6.5 feet long. They have a diet of crustaceans, fish, worms, and clams. The oldest leopard shark lived to 24 years old. The female shark has eggs that hatch inside and then the offspring are born alive. These sharks are eaten by humans and great white sharks. The leopard shark blends in with mud, plants, and coral on the bottom of the ocean, ranging from Oregon to Baja California.
